Findings

Water use fell across the region during the year [3].
Smaller farms led the change (Smith et al., 2020) in most districts.

Researchers credit new irrigation schedules for the steady decline
and expect the trend to continue next season.

Methods

Each site was visited monthly and readings were logged by hand. Totals were checked against meter records [4–5].

Confidential: raw site names are withheld from this report.

Outlook

Planners will review the schedules again next spring (Jones, 2021a) before any new targets are set for the coming years.
